

Copper Wire Jumper Kit

This kit is for tanks that have a “Step-Out” on the side wall that you would like to install our external MODA sensor on.

The jumper kit comes with 2 sets of 2 copper pads with 1 wire soldered between them. This is a jumper pad to connect the foil between the main portion of the tank and the step-out section. See the picture below.

To install this jumper kit, follow the foil installation instructions that came with your sensor but **do not** put foil on the underside of the “step-out” on your tank. Only put foil on the **vertical** portions according to the sensor installation instructions.

Peel the backing off of the copper pads and put one on the top of the lower aluminum tape and one on the bottom of the upper portion of the aluminum tape as shown above to “jumper” the two strips together.

You may have a slight jump in the reading when the fluid reaches this break but it shouldn't be too noticeable.

If you have any questions when you receive this, please feel free to contact our tech support department.

Thank you,
